Maintaining payment security is an important responsiblity for restaurant operators.

Your Responsibility to Keep Informed

If SpeedLine handled your installation, your new POS has been professionally installed by a Qualified Integrator and Reseller (QIR) certified Training and Installation Specialist. This is required by PCI SSC for all PA-DSS validated applications like SpeedLine, and it means that you're starting off on the right foot to safeguard your customer payment information.

But, for your business to be fully PCI compliant, you need to stay informed, and install security updates to payment and POS software within 30 days of their announcement. SpeedLine announces security updates by posting them to the Support Advisories blog.

Support Advisories

Critical support advisories and news about product updates.

Support Advisories

To ensure you are receiving announcements about software updates that can affect your PCI compliance, restaurant owners or key IT contacts are subscribed to the Support Advisories mailing list during onboarding.

To subscribe more people at your company, or to view support advisories at any time, visit the Support Advisories page at https://info.speedlinesolutions.com/supportadvisories.

How to Keep Your Business PCI-Compliant

While purchasing PA-DSS compliant software is a good start, maintaining payment security is your ongoing responsiblity. As a credit card processing merchant, you are required to complete an annual self-assessment questionnaire and quarterly network security scans through a PCI-approved scan vendor to demonstrate compliance.

Keys to PCI compliance include proper network security, careful handling of customer cardholder data, and the use of only PA-DSS-validated POS and payment processing systems.

For more information, visit:
- The Payment Processing & Security page on the Customer Support site.
- The PCI Security Standards site.

What's at Stake

If a credit card breach is tracked to your restaurant, and you are unable to demonstrate PCI compliance, it could cost you more in fines and other penalties than your business can absorb.

Even without a breach, financial institutions enforce the requirement for an annual PCI security self-assessment and quarterly network scans, and can levy fines for non-compliance. If your business is found non-compliant, you could lose the ability to accept credit cards.
