# Secret Server for Business Users

Incorporate all privileged users and applications in your enterprise PAM strategy

Sensitive data and critical functions are concentrated in business applications such as ERP, HR, and CRM systems. Users of these applications aren't IT staff and aren't using domain admin accounts. They do, however, have privileged access and many opportunities to increase risk.

Enterprises have approximately 300 business applications, 98 unique billing owners, and 20,000 app-to-person connections.<sup>1</sup> Budgets and purchasing decisions for applications are increasingly held by business units, which means that security teams often can't account for all the applications in use, let alone secure privileged access to them.

## Post-it notes, browsers, and consumer vaults poor business user behavior opens the door to privileged account attacks

Business users are notoriously poor at protecting passwords. People often use the same password across multiple applications and share credentials with others. People use the same password for personal use as for business use, which expands the attack surface.

To remember passwords, some business users rely on spreadsheets or Post-It notes, which can easily be stolen. Some save their log-in credentials in their browser, which is easily cracked.

Some users may be using a consumer vault, which is out of the control of the IT admin. This approach presents several problems for enterprise security.

- Consumer and browser vaults put the security onus on individuals, not the organization.

- Security teams can't ensure compliance requirements are met for password complexity, force rotation or expiration policies, or set requirements for MFA.
- You can't create comprehensive reports for executives or auditors that include all privileged account behavior.
- Consumer and browser vaults are not seamlessly integrated with other enterprise tools so people must interrupt their work to use them. They get frustrated and may stop using them altogether.

There is a better way.

Secret Server business user licenses empower privileged business users to manage passwords securely. By including business users in a central, IT-managed vault, you reduce risk and gain oversight for business user behavior without impeding productivity.

## Benefits of Secret Server for business users

With Secret Server, business users don't need to worry about taking on responsibility for privileged access management. With **Role-Based Access Control (RBAC)** you control what users can do. They can access the data they need to do their job, securely.

## Direct access to Secret Server

To store and check out passwords, business users can simply log into Secret Server's easy-to-use, intuitive interface.

- Each business user has their own folder structure to store unique secrets.
- They can easily access passwords on the go, with **Secret Server Mobile**.

## Behind the scenes of a business user's workflow

Business users can also leverage Secret Server without logging directly into the user interface.

- For access to web-based applications, they can log in via Secret Server's **Web Password Filler** to get to their stored credentials.
- Slack users can access passwords through the Secret Server integration.

## When business users rely on Secret Server, IT security benefits Too

When all privileged users across the enterprise are using a PAM solution for privileged access, IT operations and security teams get consistent, central oversight, with **Session Management** as well as comprehensive **Auditing and Reporting**.

Secret Server's architecture, on-premise or in the cloud, offers high availability for all privileged users, even when thousands are accessing secrets at the same time.

## Cost-effective business user security

Secret Server has license-based pricing for business users that is tiered based on volume, which makes award-winning enterprise-scale PAM affordable, even for organizations with thousands of business users.

# Delinea

Delinea is a leading provider of privileged access management (PAM) solutions that make security seamless for the modern, hybrid enterprise. Our solutions empower organizations to secure critical data, devices, code, and cloud infrastructure to help reduce risk, ensure compliance, and simplify security. Delinea removes complexity and defines the boundaries of access for thousands of customers worldwide, including over half of the Fortune 100. [delinea.com](https://delinea.com)
