

Hagerman Automation Connection for Autodesk® Inventor®

Automation Connection offers a simple solution for companies that deliver customized, engineered to order (ETO) or configured to order (CTO) solutions under tight deadlines.

What does it do?

Automation Connection provides design automation for repetitive/ menial modeling tasks for ETO/CTO projects. This simple yet powerful CAD job processor can read in design parameters for a given order, launch the appropriate CAD application, and automatically generate new engineering information and documentation. No direct interaction with the CAD application is required. All you need is an existing parametric CAD model.

With Automation Connection, you can:

- Improve engineering throughput
- Expand CTO/ETO product offerings without adding engineering resources
- Increase your available time for product development or higher margin custom work
- Reduce turnaround time for RFQs

Automation Connection is easy to implement and works with both Autodesk Inventor and AutoCAD®. Interoperability with Revit® is coming soon.
