Kingman Regional Medical Center Makes Strides in Value-based Care with MEDITECH

As the largest provider in northwest Arizona and the last remaining nonprofit in the county, Kingman Regional Medical Center is committed to delivering value-based care. Recognizing that patient management and clinical quality metrics are key to identifying areas for improvement, they engaged MEDITECH Professional Services to implement a robust, KPI-driven solution within six months; this initiative laid a solid foundation for KRMC’s efforts to improve care quality while optimizing their financial return.

So far, the KPI-driven solution has streamlined clinical workflows for capturing discrete data and led to new strategies for preventive health management. Robust reporting mechanisms have helped to improve the quality of care they provide while offering new opportunities for financial reimbursement from insurance payers.

Targeting people, process, and performance

KRMC engaged a multidisciplinary committee of over 40 stakeholders including physicians, nurses, IT analysts, and IS staff in addition to the MEDITECH Professional Services team. Together, they adjusted workflows to meet the needs of the hospital and align with MEDITECH’s regulatory best practices, addressing operational efficiencies by incorporating workflows to facilitate access, assignment, and accountability.

Working with MEDITECH Professional Services, KRMC staff received expert guidance and designated resources to help them make the required process changes and maximize the efficiency of new processes. In addition, KRMC learned quality reporting strategies from the team, enabling the hospital to tackle future projects independently.

"It was our first time working with MEDITECH Professional Services, and they have been a tremendous help," said Arek Shennar, CIO of KRMC. “The most important part for me as a CIO is that we’re being taught, enabling us to ask more sophisticated questions and work on more sophisticated projects."

Partnering with payers to improve financial reimbursement

KRMC targeted Medicare Condition and Patient Management benchmarks, and identified Humana Medicare Advantage patients, the largest volume payer for this subset. For the project to succeed, onboarding Humana as a payer was vital.

“We’ve been working with Humana for a while, but we needed to function as partners to promote better outcomes, improve quality measures, and enhance reporting,” explained Shennar. “This project enabled us to do that, to work toward a common goal.”

KRMC looked to Humana’s 2019 Q4 Quality Recognition Program report for opportunities. The report calculated approximately $16K in missed opportunities per quarter for diabetes HEDIS/Patient Safety Measures and Clinical/Strategic Initiatives. By implementing electronic...
clinical quality measure mapping and adjusting workflows for discrete data capture, KRMC could close gaps between opportunities and actual reimbursements from Humana.

Improving and coordinating diabetes care

KRMC chose diabetes as their pilot condition. Due to the high volume of diabetic patients under their care, KRMC felt the condition presented a scalable use case with ample opportunity to build out, test, and train. Additionally, 60 percent of their quality measures, including eCQMs, are linked to diabetes. The program aimed to provide more comprehensive care -- and more appropriate documentation of that care -- to diabetes patients, leading to improved reimbursement and Medicare star ratings.

To set organizational thresholds for improvement, KRMC implemented a Quality Vantage dashboard in MEDITECH’s Ambulatory solution to measure performance. The interactive dashboard displays in red text all metrics that require attention, allowing the organization to adjust criteria for condition management and wellness registries. For example, when the dashboard indicated that eye exams were at one percent, KRMC targeted the metric by including eye exams as part of diabetic patients’ follow-up care. In addition to helping staff manage diabetes quality measures for MIPS eCQM reporting, the dashboard has eliminated surprises related to analytics.

Planning for the future

KRMC looks forward to establishing partnerships with other hospital payers in the future. With the knowledge gained from working with MEDITECH Professional Services, they expect to address additional quality initiatives and expand the nurse navigator role to further improve outcomes and the patient experience.

As KRMC moves toward a complete value-based care solution, their engagement with MEDITECH Professional Services continues; Shennar noted that his organization plans to extend the value-based care program with Humana to include cardiac and renal care, behavioral health, and hypertension management.

“This is just the beginning of our journey,” said Shennar. “We experienced a very positive outcome from this [engagement] and fully expect to replicate it in other areas. I look forward to continuing to work with MEDITECH Professional Services.”
