

The mobile machinery industry is evolving quickly. Manufacturers have to meet increasingly tight requirements for productivity, profitability, quality and environmental responsibilities.

New trends toward electrification are emerging from the need of agricultural equipment to reduce cost and increase yields and from the necessity for construction equipment and other mobile equipment to meet lower CO2 emissions.

Electric components in machinery tend to be more efficient and require less maintenance than traditional pneumatic and hydraulic systems.

At Ewellix we are at the forefront of this technology. Our CAHB electromechanical actuators are engineered to operate in severe environments featuring robust metal gears and corrosion resistant housings. They are virtually maintenance-free and can increase the cost effectiveness of mobile machinery and agricultural equipment.
