

# Spinpanel auto-license adjustment

What is it and how does it benefit you as a partner?

Spinpanel auto-license adjustment is a nifty Spinpanel feature that can easily be overlooked. It is a unique piece of functionality that can help your customers save money with minimal additional effort.

## What does it do?

In short: Spinpanel auto-license adjustment ensures **customers do not pay for licenses that they aren't using.**

When auto-license adjustment is switched on for a customer, Spinpanel will scan all of the customer's licenses to see if they are assigned or not. When licenses are found to be unassigned, these licenses will be removed and subscriptions can even be suspended if they are no longer in use, effectively making sure customers do not pay for unassigned licenses. Spinpanel checks for excess licenses every 24 hours.

## Rethinking license management

In a traditional approach, a Microsoft Partner would first check if there is a license in stock before assigning it to a user. In the Microsoft Partner Center this is a familiar process to many businesses; buy a license, then assign a license.

In Spinpanel, **these two steps are merged into one.** This means that in Spinpanel you do not need to check how many licenses you have in stock, because the moment you assign a license, Spinpanel provisions and assigns it instantly.

## Saving time and adding value

Auto-license adjustment is great feature to offer to your customer as added value, because you're literally helping them save money by turning it on. In addition, you're bringing a two-step process down to one, saving them time. What's not to like?

## Spinpanel auto-increment

We understand that for some customers, getting used to the idea of never having to check whether you have enough licenses in stock can be a challenge. In addition, there can sometimes be valid reasons for wanting to have excess licenses. For these cases we offer Spinpanel auto increment. When this is switched on for a customer, what happens is that when you or a customer assigns a license, Spinpanel does not check if there is a license available, but always orders a brand new license of whatever is being assigned. This means that when you have 20 licenses in stock and you assign one, you will still be left with 20 in stock.
