

Modern business requires a fundamental shift in the way IT organizations deploy and manage technology.

The rapid change and complexity of today's infrastructure demands solutions that are easy to use, reduce human error, and ensure compliance.

Pliant's low-code platform for Process Automation simplifies how operations and engineering organizations build and deploy automation. By transforming API code into low-code building blocks, Pliant simplifies, streamlines, and secures the communication between your mission-critical platforms, services, and applications.

Nearly 40% of IT professionals across silos report that writing the code to automate at the API-level is their biggest challenge.

The Solution

Pliant has abstracted thousands of vendor APIs to create intelligent action blocks allowing users to drag-and-drop blocks, rather than writing and rewriting lines of code. **From a single platform, citizen developers are able to build consistent and meaningful automation across platforms, services, and applications in minutes — maximizing value across the entire technology stack in one place.**

Our customers have experienced:

- Accelerated remediation process and faster mean time to resolution
- Reduction in time to market for new service launches
- Centralized administrative control and transparency

Our Core Tenets

Automation

Design and deploy an automation strategy at scale to enable true digital transformation.

Security and Compliance

Automate remediation of critical security flaws and perpetually maintain compliance.

Enabler for Transformation

Move data between systems quickly and seamlessly for scalability as the business grows.

"Pliant automation lets our representatives spend more time **focused on obtaining and assisting customers rather than spending time on updating information** in the multiple systems that are needed to run a business like WhyFly."

— Nick Sabean, CRO/CMO

Platform Architecture

Pliant's Infrastructure Automation Platform for Enterprise & Service Provider infrastructures help Ops teams quickly create sophisticated and robust workflows enabling automation across all systems. This centralized automation saves time and money versus building "one-off" scripts or traditional fragile integrations.

Orchestration, automation, and response combined with life cycle management are cornerstones of the platform.

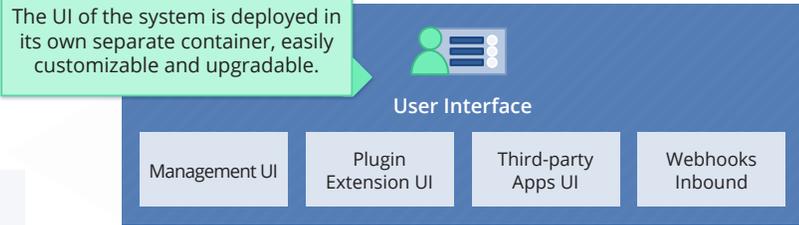

How it Works

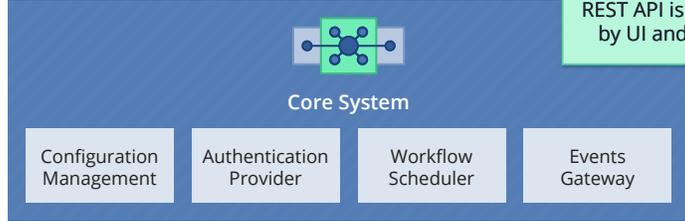

Our ability to add new APIs in 15 business days, enables anything that is not already out of the box to be included in an industry-leading timeframe.

For more on the API integrations we support and our process for adding the APIs specific to your technology stack, [visit our Integration Library](#).

The UI of the system is deployed in its own separate container, easily customizable and upgradable.

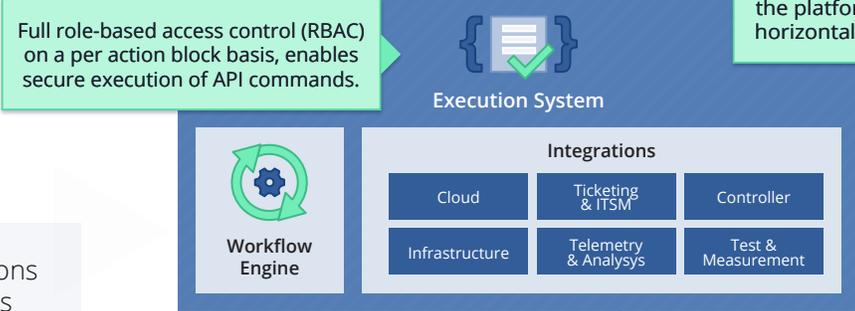

The fully OpenAPI-compliant REST API is easily consumed by UI and client services.

Message Bus easily allows the platform to scale both horizontally and vertically.

Full role-based access control (RBAC) on a per action block basis, enables secure execution of API commands.

Integrations generate workflow building blocks using a lowcode interface to simplify API programming for automation and execution.
