

With so much structured and unstructured information to sort through, eDiscovery can be complex, time-consuming, and costly for any organization. Simflofy's eDiscovery Search technology helps you easily sort through high volumes of electronic documents and information to find and flag relevant content for a number of legal use cases.

Whether you're trying to bolster litigation discovery, audits, or online investigations, Simflofy provides powerful search capabilities, content collection, legal holds, and analytics to bring you greater control over the discovery process at a fraction of the cost.

## Save time and cut costs

Federated document management extends eDiscovery searches across multiple legacy systems, making the response to e-discovery events simpler, faster, and more cost-effective.

## Comply with standards

Simply export the results in the Electronic Discovery Reference Model (EDRM) XML format for import into eDiscovery software or review tools.

## Minimize business impact

Improved speed and accuracy in responding to eDiscovery requests will help limit the risk of case loss due to incomplete or incorrect responses.

## Gain control over your records

Reduce the need for content migration by applying Legal Holds to content across different, disparate systems for centralized control of all records.

## Ensure user adoption

The easy-to-use federation feature allows users to perform simple or complex searches with a combined or filtered result set.

## Maintain high security

Search results are filtered by source system permissions, so users only see the content made available to them by admin.
