

# Duotank inliner recycling process

# Duotank inliner recycling process

## Route cause explanation:

- 1 The tankbeer truckdriver collects the used inliners when he is delivering beer and brings the inliner to the brewery
- 2 At the brewery the inliners are pressed into material packages. (The type of press depend on the number of inliners per month)
- 3 The inliner packages are transported to a regional collection centre. Based upon the type of inliners purchased by the brewery, Duotank can provide the collection point with a specification of the average materials in the pressed packages based upon the average volumes purchased. This can be a mix of different inliners
- 4 At the collection point inliners are gathered from different breweries and other industries.
- 5 The collection point combines pressed packages from different sources to make the desired “plastic mix”
- 6 This mix of materials is shipped per complete container to the recycling companies, which are located in various countries spread over Europe.
- 7 The recycling company recycles the plastic mix into granulate, which is the base material to produce new plastic products.

CIRCULAR  
ECONOMY

## Circular Economy

If a you want to make the system Circular you can specify to your supplier of plastic products that they need to use a certain percentage of this material in their plastic blend. Likely you have a supplier for per example crates, buttons, handles etc..
