

Senior Full-Stack Engineer (m/w/d)

How do you guarantee success when studying for a degree? Of course, you need enthusiasm for the subject, ideally you have top lecturers, you may work hard and master the exams. But, more than that, it's important to understand the applications of your studies in real-life and, early on, form connections that help pave the way into professional life.

Our platform connects talents with teams in business, industry or scientific and research institutions. It consists of our mobile app for students and doctoral candidates (B2C) and our web app for team leaders and subject matter experts in organisations (B2B) and of course the ability to match both sides perfectly.

Your Role at talentbay:

As one of the early employees, based in Munich (but initially working remotely), you will be joining a small but growing international team of software engineers, UX designers, data scientists and business experts with decades of experience in their respective fields. Working closely with your colleagues, you are responsible for the architecture, development and integration of new features on top of our already existing foundation.

Our Environment:

With a DevOps-first mindset, all code we create is pushed automatically to staging and live environments after review. Hosted within a Kubernetes environment on Azure, our main application is written in Elixir (with Phoenix as a web framework), with a GraphQL API being accessed by both a cross-platform Mobile App written in React Native as well as a Web Application written in React. On top of that, we use Python for everything Data-Science related. The performance and status of our systems are monitored with Grafana, with Prometheus and Loki as data providers.

Processually, we are working with an agile, Kanban – based approach. Team-wide coordination and communication happens via Slack with bi-weekly standup calls and weekly review meetings for synchronization.

Your Expertise:

- Excellent skills in Software development with node.js / React and / or Elixir
- A proven track record in creating scalable, cloud-based systems
- Experience working with Docker and preferably Kubernetes-based environments
- Experience working with Azure or AWS infrastructure
- Fluent English, written and spoken, and preferably basic understanding of German
