

The Next Generation of Cybersecurity

The SolarWinds attack was a pivotal moment for cybersecurity, proving that sophisticated threat actors could breach an organization through their trusted digital supply chain. ThreatWarrior is helping solve this problem through advanced Digital Supply Chain Protection – identifying known threat signatures and anomalies in your digital supply chain, including in your other security tools.

ThreatWarrior's Network and Digital Supply Chain Protection is powered by multiple engines that enable you to see your entire network, learn the behavior of everything connected to it, and act efficiently to stop all cyber threats. While powerful on their own, the engines work together to correlate network events and behaviors to deliver maximum contextual intelligence.

ThreatWarrior is natively built to help you better protect your digital supply chain. It sees and defends your homegrown applications, devices and third-party tools. It even helps protect your other critical software applications. The solution utilizes deep learning to determine a baseline of normal behavior for your entire network and everything connected to it. It leverages state-of-the-art techniques to detect anomalies and mitigate cyber threats, going beyond the capabilities of Bayesian machine learning, agent-based solutions, log readers, and other legacy techniques. Put simply, our technology stops threats others can't.

Unlike first-generation solutions, the ThreatWarrior platform analyzes data with more than 6 million traffic classifications and 250 protocols. We process layer 2 through 7 data tied together with raw network traffic, parsed protocol data, known threats and AI behavioral learning results to provide full-context situational awareness. Our 3D Universe visualizes this data in real time, cutting through the noise to keep your security team ahead of cyberattacks.

"One day, a security tool began unexpectedly scanning our network. It turned out to be benign – the vendor added this functionality in an auto-update but never informed us. ThreatWarrior detected this anomaly when no other tool did. This gives us the confidence that ThreatWarrior provides a much needed additional layer of protection over our security supply chain."

Solution Features

See everything connected to your network while remaining invisible to sophisticated threat actors

Learn the behavior of everything connected to the network, instantly detecting anomalies

Act efficiently on all threats with automated remediation and smart routing

Superior threat protection via unsupervised deep neural networks

Identify internal and external threats across your network and digital supply chain

Deploys in less than 20 minutes without agent installation or complex configurations

SEE

- See everything connected to the network while remaining invisible
- Know what's inside the wire – the only source of truth – through continuous deep packet inspection
- Detect internal and external threats in flight
- Identify more than 30,000 known threat signatures in real time, including encrypted signatures
- Complete on-premises, hybrid and public cloud visibility
- Superior 3D user experience
- Complete hybrid and public cloud, IoT/OT, industrial and traditional network visibility

LEARN

- Detect changes in vendor products' behavior and functionality
- Exponential approach to deep learning using unsupervised neural networks
- Continuously monitor and profile normal behavior of everything on the network and in digital supply chain
- Uncover threat activity through advanced heuristics and behavioral monitoring
- Proactively escalate severe threats over low-priority incidents to reduce alert fatigue and keep analysts focused where needed

ACT

- Extensible threat score to activate high-priority alert for critical applications
- Manual or autonomous responses to address threats faster and more effectively
- Smart threat routing to appropriately-skilled analysts to ensure proper response
- Proactive threat hunting capabilities
- Easy integration with other tooling including EDR, firewalls, and more
- More accurately identify the signal through the noise and reduce false positives

Get Results in Minutes

ThreatWarrior is deployed as a SaaS-delivered virtual sensor that gives you the power to extend advanced cybersecurity across your entire network and into your cloud. Our sensors run inside your environment on cloud components you create, giving you complete control over your security. ThreatWarrior natively integrates with Google Cloud, AWS, Azure, any OVA-compliant hypervisor, and more.

Guided. Fast. Easy.

Deploying ThreatWarrior doesn't require special skills or knowledge. Our guided process helps you seamlessly connect ThreatWarrior in less than 20 minutes with easy integration into all your hybrid networks and with existing security tools.

Immediate Results

Your new sensor registers itself and, once active, illuminates blind spots, identifies security risks and compromised devices, and immediately begins protecting your network – all without complex configurations or agent installations.

Peace of Mind

It's that simple. Now rest assured knowing your network and digital supply chain are protected by the most accurate, powerful cyber defense platform in the industry.

About ThreatWarrior

ThreatWarrior is the leader in Network and Digital Supply Chain Protection, stopping known and unknown cyber threats across the network and digital supply chain. The agentless, deep learning platform analyzes network traffic in real time to eliminate blind spots, determine security vulnerabilities, and stop active threats across on-premises, cloud and hybrid environments. ThreatWarrior is the first solution to combine unsupervised neural networks, continuous deep packet inspection, behavior monitoring, network intelligence and automated response in a single platform. Leading organizations use ThreatWarrior to **see** everything happening in their network and supply chain, **learn** the behavior of everything communicating across their enterprise, and **act** efficiently to stop threats other solutions miss.
