Equities with Income

The foundation of this approach is a portfolio of 40-50 carefully selected large-cap equities along with some mid-caps. We sell covered call options against these underlying stocks in an effort to generate additional income. Our emphasis is on fundamental quality, potentially strong profitability, low debt levels and experienced management.

Risk-Reduction Levers

In addition to writing covered calls, we may implement other risk-reducing measures such as purchasing protective puts, put-spread, and actively raising cash levels as we seek to outperform in down markets. This may reduce upside potential in strong markets, portfolio volatility can be reduced.

Fund Attributes

- Seeks increased cash flow with call premiums
- Strives for enhanced returns during downward trends, although reduces upside participation capture in upward markets

Portfolio Statistics

Beta	0.65
Standard Deviation	12.6%
P/E Ratio (1 Yr. Fwd est)	22.1x
Wtd. Avg. market cap (Billion)	\$621

3. Weighted average days until expiration

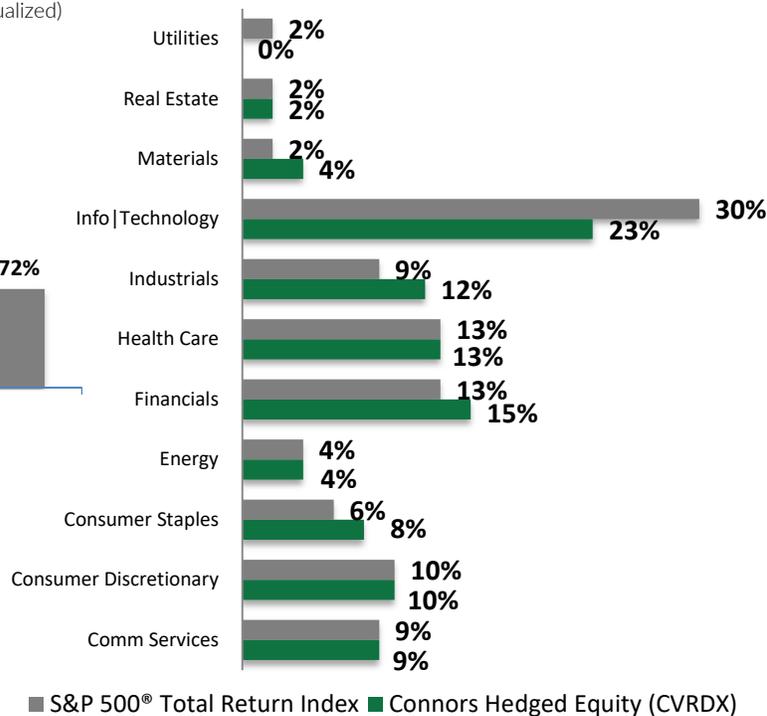

Performance Since Inception

The performance data quoted represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. Current performance may be lower or higher than the performance data quoted. For performance current to the most recent month end, please call 833-601-2676. CVRDX has a gross expense ratio of 2.43% and a net expense ratio of 1.16%, which is contractually agreed upon until March 31, 2025.

Sector Allocation

Investors should carefully consider the investment objectives, risks, charges, and expenses of the fund before investing. The prospectus contains this and other information about the fund, and it should be read carefully before investing. Investors may obtain a copy of the prospectus by calling 833-601-2676 or at www.connorsinvestor.com/mutual-funds

IMPORTANT RISK INFORMATION:

As with any mutual fund investment, there is a risk that you could lose money by investing in the Fund. The success of the Fund's investment strategy depends largely upon the Adviser's skill in selecting securities for purchase and sale by the Fund and there is no assurance that the Fund will achieve its investment objective. The Fund was formed in 2021 and has no operating history. In addition, although the principals of the Adviser have investment management experience, none have experience managing an open-end mutual fund prior to the Fund.

Investments in options involve risks different from, or possibly greater than, the risks associated with investing directly in the underlying securities.

Large-capitalization companies are generally more mature and may be unable to respond as quickly as smaller companies to new competitive challenges, such as changes in technology and consumer tastes, and may not be able to attain the high growth rate of successful smaller companies, especially during extended periods of economic expansion.

The S&P 500® Index is a market capitalization-weighted index of 500 widely held stocks often used as a proxy for the stock market. Unlike mutual funds, the index does not incur expenses. If expenses were deducted, the actual returns of this index would be lower.

The CBOE S&P 500 BuyWrite IndexSM (BXM) is a passive total return index based on (1) buying an S&P 500 stock index portfolio, and (2) "writing" (or selling) the near-term S&P 500 Index (SPXSM) "covered" call option, generally on the third Friday of each month. An investor cannot invest in an index and index returns are not indicative of the performance of any specific investment.

Volatility: A statistical measure of dispersion of returns.

Covered call: Selling a call option on an underlying long held security.

Protective put: Purchase of a put option vs a long underlying equity position or broad index that is not necessarily held.

Put spreads: purchase near strike put while selling another lower strike put. Defined percentage protection against downside participation with market weakness. Usually initiated vs broad market index.

Out of the money: Out of the money refers to a call option with a strike price that is higher than the market price of the underlying asset, or a put option with a strike price that is lower than the market price of the underlying asset.

Days Until expiration: The expiration time of an options contract or other derivative is the exact date and time when it is rendered null and void.

Weighted average % of shares written: weighted average percentage of shares that are covered by written (sold) call options.

Weighted average % out of the money: weighted average percentage at time of initiation of stock price to the strike price of the call option (potential sale price) for all positions in the fund.

Weighted average days until expiration: weighted average days to maturity at initiation between the implementation date and expiration of the option.
